Sunshine State
CANNING & BOTTLING

CAPABILITIES OVERVIEW

Your beverage, start to finish.

Contract canning, bottling and end-to-end beverage production for alcoholic and non-alcoholic brands. Fort Lauderdale, Florida.

PREPARED FOR
Prospective production partners

CATEGORIES
Alcoholic & non-alcoholic

FACILITY
Fort Lauderdale, FL

AT A GLANCE

What SSCB does.

Cans & bottles

Aluminum can filling and seaming, plus glass bottling — all under one roof

ABV & non-alc

Bottled spirits, RTD cocktails and hard seltzer alongside water, juice, tea and functionals

Full scope

Formulation, compliance, design, blending, filling and labeling — through to release-ready pallets

Any run size

Smaller first orders through to larger, repeat production

Two ways to engage

- **Full turnkey.** We procure cans, closures, labels, ingredients and packaging, run the batch, and deliver release-ready pallets with full documentation.
- **Co-packing only.** You ship materials against an approved spec. We schedule the run, fill, seam, label, code and palletize.

What makes us different

- The whole production process sits with one company — one schedule, one point of contact, one party accountable.
- Warehousing and distribution handed to established partners, documentation already in order.
- Alcoholic and non-alcoholic production in the same building, so a brand can run both without a second vendor.
- No order too small — a first short run gets the same line as a standing one.

THE PROBLEM WE SOLVE

Five vendors. Five timelines. Nobody accountable.

The standard path to a canned beverage runs through a formulator, a compliance consultant, a design studio, a co-packer and a warehouse. Five contracts. Five schedules. And when a date slips, every one of them points at somebody else.

We consolidated the production side of that into a single company. Everything up to release-ready pallets sits with us — one schedule, one accountable party. Warehousing and distribution we hand to established partners, rather than doing it adequately ourselves.

CAPABILITIES

One partner for the whole line.

01

Formulation & R&D

Recipe development, reformulation and bench-to-batch scale-up. Flavor, carbonation, ABV and shelf stability dialed in before anything is made.

02

Compliance & Labeling

Ingredient review, nutrition and allergen statements, alcohol label copy and government warnings, label approval and filing support.

03

Design & Packaging

Can and bottle artwork, shrink sleeve and label design, dielines and print-ready files, secondary packaging and case configuration.

04

Blending & Batching

Wet-side production in-house: water treatment, ingredient staging, blending, carbonation, proofing, with QC logged at each stage.

05

Canning & Bottling

Aluminum can filling and seaming, glass bottling with corking, inline date and lot coding on every unit.

06

Distribution Handoff

Goods finished, palletized and documented, then a warm introduction to warehousing and distribution partners we work with.

PACKAGING FORMATS

Formats and fill sizes.

ALUMINUM CANS

FORMAT	TYPICAL USE
12 oz sleek CONFIRM	Hard seltzer, RTD cocktails
12 oz standard CONFIRM	Tea, juice, RTD cocktails
16 oz standard CONFIRM	Energy, functional, long drinks

GLASS BOTTLES

FORMAT	TYPICAL USE
750 ml CONFIRM	Vodka, whiskey, gin, rum
1 L CONFIRM	Vodka, whiskey, gin, rum
1.5 L CONFIRM	Vodka, whiskey, gin, rum

Closures, lid finishes, sleeve and label types and case configurations are specified per project. Line scheduling is sized to your run rather than fixed to a standing slot, so an order of any size gets a real window — we quote it once format and volume are set.

PRODUCT CATEGORIES

Alcoholic and non-alcoholic, side by side.

CAN LINE, MID-RUN

ALCOHOLIC

- Ready-to-drink cocktails
- Hard seltzer
- Spirits-based coolers and long drinks
- Canned highballs and mixed drinks
- Bottled spirits — vodka, whiskey, gin and rum

NON-ALCOHOLIC

- Still water
- Juice and juice blends
- Iced tea and coffee
- Energy and functional drinks
- Mixers and mocktails

Alcoholic products are built from purchased spirits — we blend, fill and package, and bottle finished spirits straight. We do not ferment, brew or distill, so beer, wine and malt-based products sit outside what we do. Running both categories in one facility means a brand extending from an RTD into a zero-proof line — or the reverse — does not have to qualify a second producer or split its supply chain.

Formulation, R&D and compliance.

Formulation & R&D

Scale-up is where most beverage launches fail. A recipe that works in a five-gallon test kitchen behaves differently at production volume. We build that step into the process rather than discovering it on run day.

- New product formulation and flavor development
- Reformulation and cost-down reworks
- Carbonation, ABV, pH and Brix targeting
- Shelf-life and stability planning
- Bench-to-batch scale-up trials

Regulatory & labeling

Alcoholic products carry a second layer of regulation on top of food safety, and incorrect label copy can stall a launch by months. We run the paperwork alongside the production schedule so the two never fall out of sync.

- Ingredient and formula review
- Nutrition facts and allergen statements
- Alcohol label copy, ABV and government warnings
- Label approval and filing support
- Lot coding, traceability and batch records

DESIGN

Packaging and artwork.

A can is a billboard that sits four inches from a buyer's face in a cooler door. We design artwork that survives that test and produces cleanly on the actual substrate, at the actual print process you are paying for.

SEALED AND CODED, READY FOR SLEEVING

Artwork

Can and bottle label design, brand identity support for new launches, and adaptation of existing brand systems to beverage packaging.

Production files

Dielines, print-ready file preparation, colour separation guidance and proofing against the chosen substrate and print method.

Packaging design

Shrink sleeve and pressure-sensitive label design, secondary packaging and cartons, tray, case and pallet configuration.

We design labels and supply print-ready files; the printing itself is done by your printer. Already have a design team? We accept finished files and will flag technical issues before they reach the press.

PRODUCTION

Blending, filling and quality.

Wet side

Water treatment, ingredient staging, blending, carbonation and proofing, with QC checks logged at every stage of the batch.

Aluminum cans

Filling and seaming in 12 oz sleek, 12 oz standard and 16 oz standard, with inline date and lot coding, seam inspection and fill-level verification.

Glass bottles

Spirits bottling in 750 ml, 1 L and 1.5 L with corking, seal verification, and the same coding and traceability applied on the can line.

Quality & traceability

- In-process QC checks recorded against each batch
- Fill level, seal integrity and seam verification
- Lot coding on every unit for downstream traceability
- Retained samples and batch records held on file
- Finished goods checked against spec before release

Standards

Credential set relevant to our operation. Contact us for current documentation on any standard your product or retailer requires.

- FDA registered food facility
- HACCP plan
- TTB alcohol permit
- Good manufacturing practices

WHERE OUR SCOPE ENDS

The handoff.

SSCB does not warehouse or distribute. We're a production company, and we would rather say so plainly than run a mediocre warehouse operation on the side.

What you receive from us

- Finished goods, coded and palletized to your distributor's spec
- Pallet configuration and case counts confirmed before the run
- Batch records and release documentation handed over with the product
- Goods built to arrive ready to receive, not ready to argue about

Where we hand you next

We have warehousing and distribution partners lined up who take finished pallets into storage and out to market. When your run is complete we make the introduction and pass across everything the receiving side needs, so you are not cold-calling warehouses with a truck already loaded.

Already have a 3PL or distributor? We coordinate with them instead. The handoff is the same either way: your goods arrive documented, on spec, and on time.

FINISHED GOODS STAGED FOR COLLECTION

South Florida is a practical place to produce: port access for imported materials, a dense distributor and on-premise market, and a year-round tourism economy that moves real volume. Shortening the distance between filler and distributor takes days and handling out of the chain.

From first call to finished pallets.

01

Discovery call

Product, volume, format, budget and launch date. You leave knowing whether turnkey or co-pack fits, and roughly what it costs.

02

Formulation & samples

We develop or refine the liquid and send samples. We iterate until you sign off on flavor, carbonation, ABV and mouthfeel.

03

Compliance review

Formula reviewed against regulatory requirements, label copy built, filings prepared for your category and distribution states.

04

Artwork & materials

Design goes to print-ready files. We procure materials on turnkey projects; on co-pack you ship against a receiving window.

05

Your run

Scheduled blending, filling, seaming or corking, labeling, coding and palletizing, with QC checks and records throughout — first order or fiftieth.

06

QC & release

Finished goods checked against spec before release, with retained samples and documentation held on file for traceability.

07

Handoff

Goods leave finished, palletized and documented. We introduce you to warehousing and distribution partners, or coordinate with the 3PL you already use.
